

ITC 255

April 27 2017

Anu Slorah

1. Identify and list the domain level classes. Domain level classes are the classes that have to do with the main business concerns of the project. (Other types of classes would be the data classes, display classes, utility classes)

2. Create class diagrams for those domain level classes. Try to make sure they have a complete list of attributes and methods. Also try to make sure the classes embody Encapsulation principles (Each class should do one thing, it should be as self sufficient as possible)
